

Aleksandre Giorgadze

Junior Python Developer, focused on automation and AI-augmented internal tools

ABOUT

I write Python that removes work nobody should be doing by hand. At Flat Rock Technology I spend my days inside marketplace listing data, where the same corrections come up thousands of times, and over the past year I have built the tooling that handles them: a parser for Amazon's validation schemas, an AI tool that reads product photos to recover missing attributes, and report automation that replaced a manual Excel routine. Nobody assigned me any of these. I noticed the pattern, built something, and showed it to the team afterwards.

I am studying Computer Science at Ilia State University, having transferred from Physics, and I am comfortable with the mathematical and structured-data side of the work. What I want next is a role where building the internal tools is the job itself rather than something I fit around it.

EXPERIENCE

Web Developer

Jul 2026 – Present

Portex Georgia, an international freight forwarder

Tbilisi

- Sole developer of portexgeo.com: a bilingual English and Georgian marketing site, plus an authenticated customer portal where clients look up the status, route and estimated arrival of their containers instead of emailing the operations team to ask.
- Built on React and TypeScript with Tailwind, using Supabase for authentication, storage and the Postgres database behind the portal.
- Handled SEO and structured data as part of the build rather than retrofitting it, since most of the company's inbound enquiries arrive through search.
- Ongoing work: I maintain and extend the site rather than having handed it over.

Account Strategy Associate

Dec 2025 – Present

Flat Rock Technology

Tbilisi

- Manage and resolve Amazon and eBay listing errors at scale for a marketplace client. A single catalogue cycle opened with roughly 29,000 outstanding errors; tracing them back to the validation rules and lookup tables that caused them brought size-related failures down by around 57 percent, with just under 5,000 SKUs corrected in one two-day push.
- Wrote the internal tooling that made that possible: a JSON Schema parser for Amazon's size validation rules, an AI attribute detector that reads product photos, and automation for a supplier report that had been assembled by hand in Excel.
- Designed an AI-assisted correction workflow scoped deliberately to non-confidential product data, with a person reviewing every suggestion before it is applied, and documented it for management sign-off.

Data Analyst

Jun 2025 – Dec 2025

Flat Rock Technology

Tbilisi

- Rebuilt the recurring error and reporting workflow in Excel Power Query, replacing a manual clean-and-paste routine so the report refreshed from source instead of being reassembled by hand each cycle. The first thing I automated at Flat Rock.
- Set up recurring exports across Amazon, eBay, Google and Bing on the marketplace platform, so the same pull ran to schedule instead of being reassembled by hand for each client question.
- Supported campaign managers with day-to-day account maintenance on managed-services accounts.
- Promoted to Account Strategy Associate after six months.

Data Research Analyst

Jul 2023 – May 2024

Scandiweb

Tbilisi

- Qualified several thousand companies against ideal-customer-profile criteria in Salesforce, and ran manual QA passes over client websites, working with the developers to reproduce and close what I found. My first sustained exposure to how software actually gets debugged.

- Coordinated multi-team staffing for a 24/7 operation, resolving daily disruptions under time pressure.

PROJECTS

Product Field Analyzer

github.com/acyb3rn/product-field-analyzer

Python, OpenAI vision API, Flask, Tkinter. Built at Flat Rock Technology.

Marketplace listings get rejected when required attributes are missing, and the usual remedy is to ask the brand and wait weeks, even though the answer is often sitting in the product photograph. This reads the photograph instead. The harder half of the problem is being wrong at a volume where nobody can check every answer, so every field carries a confidence score, *unknown* is a permitted response rather than a guess, and detected values are compared against expected ones so that review effort goes where there is disagreement. It ships three ways: a command-line tool for batches, a Flask app for one-off checks, and a desktop application where a person approves each row against its photo before anything is exported.

Amazon Size Rule Extractor

github.com/acyb3rn/amazon-size-rule-extractor

Python, JSON Schema, openpyxl. Built at Flat Rock Technology.

Amazon publishes its size validation rules as if/then/else chains nested several levels deep inside JSON Schema, at roughly 450 KB per product type, with over thirty product types in the catalogue I work with. Finding the accepted values for one combination of age range and size class meant reading through the schema by hand, which took minutes and was easy to get wrong. This walks every branch and flattens the whole thing into a filterable Excel workbook, one sheet per product type, keeping the branch path on each row so any result can be traced back to the exact position in the schema it came from.

Argus Course Downloader

github.com/acyb3rn/argus

Python, Playwright, requests, Bash, scheduled with cron and launchd.

My university posts course materials to a portal with no notification and no bulk download, so checking five courses every morning was about ten minutes of clicking that never produced a decision. Argus gets through the Google OAuth wall with Playwright and then stops using the browser altogether, calling the portal's internal REST API directly. I worked those endpoints out by watching network traffic in DevTools: token refresh, the per-course materials listing, and the signed S3 URL issued for each file. It compares against what it already has and fetches only what is new. It ran at eight every morning for a full semester without missing a day.

Aware

[getaware.app](#)

JavaScript, Chrome Extensions API.

Most site blockers work on brute force: either the tab opens or it does not. Aware sits in between. It intercepts the sites you have flagged and asks for a conscious decision before letting you through, which turns an automatic habit into a choice you have to actually make. My own product, designed and built end to end, currently being prepared for release as a subscription.

EDUCATION

Ilia State University · BSc Computer Science

2025 – Present · Tbilisi

Object-oriented programming in C#, computer organisation and machine-level programming, discrete mathematics and proof, calculus.

Free University of Tbilisi · Physics

2020 – 2025 · Tbilisi

Studied physics before transferring to Ilia State University to read Computer Science.

SKILLS

Python: pandas, openpyxl, Playwright, requests, Flask, Tkinter

Also working with: SQL, JavaScript, TypeScript, React, Tailwind, Supabase and PostgreSQL, HTML and CSS, Git, Bash, Linux, C, Excel and Power Query

Areas: workflow and browser automation, scripting and job scheduling (cron and launchd), JSON Schema parsing, REST API integration, LLM and vision API integration, marketplace data, web development

Currently learning: FastAPI, SQL in more depth, and agentic AI workflows

Languages: Georgian (native), English (C1), Russian (A1)
